

Merlin Enterprise brings ease and efficiency to system monitoring on a global scale. It not only manages data for large systems, it also gives you the tools to share and make sense of the data.

### Monitor Multiple Parameters

Merlin Enterprise manages data from any sensor connected to any type of controller – importing from flat files or connecting through OPCSystems database client.

It uses a data dictionary to define sensors and measurements based on metadata included with the data stream – so no additional programming is required to set-up or define the data stream.

Additional features include QA/QC, real time alarms, charting, report generation tools as well as visual mapping of the different sites along with real-time measurements. It also supports importing and integration of manual measurements from browser-based forms (Merlin Mobile).

Configure and assess data with web-based chart and reporting tools from multiple locations.

### Monitor at Multiple Stations

Add additional monitoring sites with any combination of sensors in minutes. Once the monitoring equipment is installed, the data flows into Merlin Enterprise and the new elements are added to the existing database automatically.

A user only needs to define the engineering units (if different from defaults) and add custom names if desired. Data will flow seamlessly and without additional user interaction from the controller to the database and display software. This streamlined approach is based on a rock-solid and rigorous data management solution that is infinitely scalable.

### Manage Multiple Sites

Merlin Enterprise is integrated with SQL Server, a very stable, fast and affordable database engine. This makes monitoring and managing many locations, regardless of geographic location, easy and convenient.

Merlin Enterprise can download not only the data, but metadata including measurements, sensors, stations, and even geographic coordinates. All of this without any programming on the data collection side. Data is accessed by creating and assigning roles through the web interface.

Merlin Enterprise brings ease and efficiency to monitoring of any number of monitoring systems on a global scale.
